Professional Summary

Fullstack Engineer with nearly 3 years of production experience on a multi-tenant fintech platform. I build backend services in Go and Java within an event-driven microservice architecture, and build data-heavy dashboards in React/TypeScript. I've owned a Go API gateway end-to-end and contributed core business logic to a high-throughput order service.

Work Experience

ATOM Solution

September 2023 – Present

Software Engineer

Joined part-time during undergraduate studies, promoted to full-time based on delivery performance.

Merchant Platform

Team of ~20

A multi-tenant SaaS platform for 30,000+ merchants to manage storefront operations — orders, products, payments, and real-time transactions — across web and mobile. Built with Java, NestJS, PostgreSQL, MongoDB, Kafka, Debezium, ReactJS, and PWA.

- Implemented order-creation logic (input validation, pricing, persistence) in the Java/PostgreSQL order service — the platform's system of record for order, invoice, and payment status.
- Implemented idempotent refund workflows integrated via **gRPC** with the payment service (idempotency key, line-item amounts), persisting refunded line items.
- Implemented compensating-transaction logic (order-status rollback on payment failure) within a **Temporal**-orchestrated **saga** coordinating order creation and payment across services.
- Built Kafka producers and consumers for order events backed by the **outbox pattern** and **Debezium CDC**, in a system handling **millions of orders/month** across 30,000+ merchants; added retry with exponential backoff (4 attempts, 1s base) for service calls and message consumption.
- Shipped service updates via **Helm** chart image-tag changes in the team's GitOps workflow, and used Grafana Loki and Rancher to debug production issues.
- Co-architected the NestJS/MongoDB e-invoice **data service**, with clearly defined boundaries in the platform's microservice cluster.
- Re-architected the merchant mobile app from a legacy micro-frontend setup into a monolithic **PWA** + **Capacitor** delivery — a deliberate trade-off favoring release speed and runtime simplicity over micro-frontend coordination overhead; managed state and server cache with Zustand and TanStack Query.
- Implemented **S3** presigned-URL generation for the product service's image-upload flow, enabling direct client uploads to AWS S3.

Invoice Provider Gateway

Team of ~10

A request-forwarding gateway routing e-invoice requests to multiple providers (FPT, MISA, Viettel, M-Invoice) behind a single API — no invoice data is persisted here. Built with Golang, Redis, Docker, NextJS, and ReactJS.

- Designed and built, end-to-end, a **Go API gateway** (standard **net/http**, no framework) routing requests to the correct provider and normalizing request/response payloads across vendors, with hand-written middleware, Redis-based rate limiting, and response caching.
- Containerized the gateway with Docker for a reproducible local and deployment setup.
- Built an internal operations dashboard (React, **ApexCharts**) visualizing orders, customers, contracts, and campaign data for the ops team, consolidating what was previously spread across disconnected tools.

Technical Skills

- **Backend:** Golang (`net/http`, Gin, Chi), Java, NestJS, REST API design, gRPC, Microservices, Event-driven Architecture (Kafka, Outbox, Debezium CDC, Temporal/Saga), API Gateway Design
- **Frontend:** React, Next.js, TypeScript, Zustand, TanStack Query, Recharts, ApexCharts, PWA, Frontend Performance & State Management
- **Databases & Caching:** PostgreSQL, MongoDB, Redis
- **Cloud:** AWS S3 (presigned URLs)
- **DevOps & Observability:** Docker, Kubernetes (Helm, GitOps), Grafana Loki, Rancher, CI/CD
- **Practices:** Agile, Code Review, Multi-tenant System Design

Education

University of Information Technology – VNUHCM
Bachelor of Software Engineering

September 2021 – September 2025

Languages

English: IELTS 6.5
